Post-Flood Assessment for 1983, 1986, 1995, and 1997  
Central Valley, California

## APPENDIX B

### 1983 FLOOD HYDROGRAPHS

Plates are not presented for 1983 because the storm pattern produced a series of smaller rainfall-runoff events, when compared in magnitude to peak flows in 1986, 1995, and 1997, that did not stress the flood control capabilities of tributary projects. Most high water occurred after the rain flood period during snowmelt runoff, May through June 1983.
